

## EXECUTIVE BRIEFING

# Banking Market Intelligence

An autonomous, multi-agent research system that infers what banks in Printec's footprint will need — before they ask.

**17** countries

**Weekly** cadence

**100%** claims cited

## THE CHALLENGE

# Banks don't publish their buying plans.

Our job is to know what every bank across 17 countries will need **6–12 months before they issue an RFP** — without a single bank interview.

### The problem

Buying signals are scattered — investor decks, public tenders, regulators, job boards, vendor results — across 17 countries and a dozen languages. No single source tells you what is coming.

### The opening

Banks hire, disclose, and get regulated before they buy. Read those tells early and you reach the decision-maker while there is still a deal to shape — not after the tender is public.

### The discipline

One rule above all: never invent a number. Every figure traces to a dated, named, re-checkable source — the system only classifies and counts values that already exist.

## THE SYSTEM

# One autonomous system. Every week. Fully cited.

Six specialist research agents, a triangulating orchestrator, and an independent validator turn the open web into a board-grade brief and a live dashboard.

● Live now at [printec-market-research.vercel.app](https://printec-market-research.vercel.app) — it refreshes automatically every week with no redeploy, and every figure, deadline and forecast is one click from its source.

# How the system is organized

Each collector **fans out a subagent per bank, portal, market or competitor**; the Orchestrator **runs** the engine and **spawns** the validator. Agent counts scale to the week.

# Six specialists, six angles on the same question

Each fans out one subagent per unit — bank · portal · regulation · country · competitor — so depth scales with the week.

## Bank Disclosures

**Reads what banks tell investors.**

**Where:** IR & strategy-day decks, verbatim earnings-call transcripts

Monthly

## Tenders & Procurement

**Catches banks buying in the open.**

**Where:** TED (EU-wide API) + 15 national portals + bank-owned pages

Weekly

## Regulation & Deadlines

**Tracks the rules that force spend.**

**Where:** ECB / EBA / central banks: DORA, instant payments, accessibility

2x / month

## Market Statistics

**Measures the structural backdrop.**

**Where:** ECB Data Portal + central banks + leading indicators (Trends, apps)

Monthly

## Early Intent — Jobs + Leadership

**Spots intent before the budget.**

**Where:** Bank career pages, LinkedIn, senior-executive appointments

Weekly

## Vendors & Competitors

**Watches where money already flows.**

**Where:** 150+ rivals — giants to local peers; filings, tenders, footprint press

Weekly

# Fan out, search deep — never quit at the first wall

## Worked example — the Tenders agent (A2)

### The exhaustiveness standard

3+ search angles (keywords, languages, sources) · go one level deeper · use proxies. Only then declare a genuine gap — with the next-best alternative named.

### In practice

PrivatBank’s tenders sit behind a JavaScript-rendered portal — read via a browser, it surfaced a live recycling-ATM prequalification in a 7,401-ATM fleet.

# Confidence is earned by agreement

## From six streams to one ranked view

One agent alone caps a signal at **Medium**. Two or more independent agents — different evidence types — on the same need makes it eligible for **High**. Only the orchestrator promotes it, after re-checking the key figure on the live source.

## By evidence

How well-proven a signal is — confidence weight plus a bonus for each independent agent that confirms it.

## By value

The risk-adjusted prize — deal-size × win-probability × confidence. Threats & macro trends score zero, so noise can never outrank a concrete biddable deal.

The brief leads with value; the dashboard lets you toggle between both lenses.

## ④ THE VALIDATOR

# An independent fact-checker, by design

The weak point of any analysis is that the author proofreads their own work. So a separate set of agents re-checks the forward-looking calls — with one job: confirm every claim traces to its source, and flag the ones that don't.

### What it is

Fresh agents, spawned with a blank slate and an adversarial mandate — one fact-checker per market.

### How it stays independent

They re-read each call against the primary documents it cites — a fresh, separate pass that checks the claims, not the author. Like a code reviewer who didn't write the code: independence is fresh context, not a different schedule.

### What it produces

Each outlook is marked “✓ independently validated”; any claim it can't trace shows as a visible “⚠ not yet linked to a source” caveat — shown to the reader, never hidden. Its verdict overrides the analyst's self-assessment.

#### GROWTH

##### Ukraine · ATM modernization

Reasoned outlook with cited drivers, projected range, and an evidence trail.

✓ Independently validated

⚠ 1 claim not yet linked to a source

#### This week's audit

21

outlooks audited

honest caveat

# One live dashboard, seven questions answered

## THE SEVEN VIEWS

- This week**  
what changed — and what is hot now
- Countries**  
where to focus
- Products**  
demand by Printec solution
- Competition**  
where rivals are strong vs. thin
- Accounts & deadlines**  
who to approach, and by when
- Outlook**  
where each market is heading, and why
- Patterns & history**  
how it fits the long-run story

**Live & self-updating** — new week every Friday, no redeploy;  
time-travel to any past week; every figure one click from its source.

# A standing weekly cycle

Agents run through the week on their own schedules; Friday synthesises, validates, and publishes — automatically.

## Why a cadence matters

Weekly tenders, jobs and vendor moves catch fast-moving windows; the monthly inputs add the structural backdrop. The result is a living picture, not a one-off report.

## FRIDAY — synthesis & publish

- Triangulate the six streams → master table
- Write the reasoned outlook + run the validator
- Engine builds & publishes → dashboard + brief live

# Live today — and designed to grow

## LIVE NOW

- ✓ Expected-value ranking (value, not just visibility)
- ✓ Foresight layer — reasoned Outlook per market
- ✓ Trust pass: every source re-fetched & snapshotted
- ✓ Source links everywhere — figure → source in one click
- ✓ Independent traceability validator
- ✓ Full-size-range competitor map — local peers to giants
- ✓ Live dashboard auto-publishing every week

## ON THE HORIZON

- **Beyond banking**  
Extend to other Printec verticals — retail, fuel, postal, telco — once the method is proven.
- **Deeper leading indicators**  
Broaden the early-signal sweep (search trends, app adoption, web traffic) feeding the Outlook.
- **Competitor depth**  
Segment revenue for the listed regionals + RFP-win tracking per competitor — who actually won which deal.

**Banking-first by design:** new verticals add collectors, not a rebuild.
